Profile

DevOps/Platform engineer with production experience across Kubernetes, GitOps, and cloud-native observability. Shipped end-to-end infrastructure at Aspora (YC W22) spanning EKS, Kong, MSK, RudderStack, ArgoCD, and Datadog. Google Summer of Code 2025 contributor to **Prometheus Operator** and LFX mentee to **CNCF Kyverno**, with **30+ merged pull requests** across both upstream projects extending CEL-based policy validation and namespace-scoped policy enforcement. Accepted speaker at **KubeCon + CloudNativeCon India 2026**.

Education

Dayananda Sagar College of Engineering — Sept. 2023 – 2027
B.E. Information Science and Engineering — *CGPA: 9.33 / 10*

- **Relevant Coursework:** Operating Systems, Computer Networks, Distributed Systems, Database Management Systems, Data Structures and Algorithms, Object-Oriented Programming, Cloud Computing, Software Engineering.

Experience

Murena — Feb 2026 – Present
DevOps Engineer | Ansible, Terraform, Docker, Prometheus, Grafana, Traefik, Hetzner — *Remote · Paris, France*

- Built a **centralized monitoring platform** on Hetzner Cloud integrating **Prometheus**, **Loki**, and **Grafana Alloy**, provisioned end-to-end with **Terraform** and configured via **Ansible** playbooks for reproducible rollouts across staging and production estates.
- Fronted the observability stack with a **Traefik** reverse proxy terminating TLS via **Let's Encrypt** auto-renewal, and automated **Grafana datasource provisioning** through the Grafana REST API so new tenants land with ready-to-use dashboards.
- Deployed **OnlyOffice's** custom document-server image as an isolated deployment with Ansible-driven configuration and Traefik route protection, enforcing least-privilege access to document editing endpoints.
- Extended the shared **workspace-deployment** repository with **S3 server-side encryption with customer-provided keys (SSE-C)** support (environment template, validation logic, secret plumbing, and operator documentation), enabling customer data sovereignty across deployments.

Aspora (YC W22) — Nov 2025 – Present
DevOps Engineer | Kubernetes, Terragrunt, Vector, Quickwit, Kyverno, KEDA, AWS EKS — *Onsite · Bangalore*

- Architected a production **EKS cluster** following a **GitOps workflow** on **ArgoCD**, managing the full cloud-native stack: observability (**VictoriaMetrics**, **Beyla**, **Vector**, **Quickwit**, **YACE**, **Grafana**, **Datadog**), security (**Kyverno**), and workload autoscaling (**KEDA**).
- Deployed and operated **Kong Gateway** with a custom **Lua JWT plugin** performing **inline token verification**, **scope-based authorization**, and **rate limiting** at the edge, eliminating external auth round-trips and materially reducing request-path latency.
- Drove the **Kong JWT authentication migration across stage and production**, making JWT the default on **every API route** and retiring legacy key-auth / external-service authorization from the hot path across all microservices.
- Migrated the full observability stack from **OpenTelemetry to Datadog** across stage and production (**core-{stage,prod}**, **falcon-{stage,prod}**), onboarding all microservices with standardized service tagging, log pipelines, and SLO-ready dashboards.
- Shipped a **production-isolated staging analytics pipeline** (**RudderStack** self-hosted, **Kafka MSK**, **Aurora PostgreSQL**) on **EKS**, delivered as **ArgoCD**-managed Helm/Kustomize releases with **Kong Gateway** fronting ingress.
  - Designed end-to-end isolation: dedicated MSK topic set, separate **DynamoDB** destination-config table, S3 sink with prefix-namespaced staging bucket, and **EKS Pod Identity**-scoped IAM roles, guaranteeing zero cross-environment blast radius.
  - Implemented **Kong path-rewrite routing** (`strip_path` + upstream `service.path`) on a single clean route so staging traffic at `/eventbus-stage` is safely rewritten to the production-compatible `/eventbus` upstream contract.
  - Rolled out under an **Atlantis**-managed Terragrunt workflow spanning 19 environments and 500+ Atlantis projects, with plan-only previews, CODEOWNERS review, and drift detection on every PR.

- Instrumented the RudderStack control-plane shim and eventbus with **Four Golden Signals** dashboards (latency, traffic, errors, saturation) and wired anomaly-based alerting into Datadog for on-call triage.
- Bootstrapped a **production-mirror QA environment** end-to-end: IaC-provisioned a new AWS account (IAM roles, VPN access, Kong routes), deployed **7 core services** on EKS/ECS, and rolled out a new QA release-branching strategy across the engineering org to unblock mobile automation and regression testing.
- Owned end-to-end infrastructure for the **Shivalik/Envoy** client vertical: EKS cluster setup, Kong routing, Grafana logging, MSK + production alerting, and authored the on-call architecture reference guide for the vertical.

Linux Foundation Mentorship: CNCF Kyverno Aug 2025 – Dec 2025
LFX Mentee | Go, Kubernetes, Policy-as-Code, CEL, Admission Webhooks *Remote · San Jose, USA*

- Extended Kyverno's **CEL-based policy engine** with a complete suite of **namespace-scoped policy variants**, enabling tenant namespace owners to define and govern policies without cluster-admin privileges, substantially reducing privilege-escalation surface.
- Delivered **17+ merged PRs** spanning API types, controllers, admission webhooks, CRD generation, CLI wiring, and full test coverage:
  - **API design & common compiler interface:** introduced `NamespacedValidatingPolicy` (#14121), `NamespacedImageValidatingPolicy` (#14195), `NamespacedMutatingPolicy` (#14225), `NamespacedGeneratingPolicy` (#14400), and `NamespaceDeletingPolicy` (#14050) with a shared compiler contract across policy kinds.
  - **Controller & webhook wiring:** amended upstream controllers and admission controllers for `ValidatingPolicy` (#14155), `DeletingPolicy` (#14098), `ImageValidatingPolicy` (#14242), and `GeneratingPolicy` (#14431) to resolve and enforce namespace-scoped variants.
  - **Distribution:** generated and copied CRDs to the Kyverno CLI bundle for `nvpol` and `ndpol` (#14316), keeping `kyverno apply` and policy validation parity with cluster-scoped resources.
  - **Test coverage:** authored unit tests (#14097, #14224) and Chainsaw end-to-end tests wired into CI (#14315, #14449), guarding regression across all namespaced policy kinds.

Google Summer of Code 2025: Prometheus Operator May 2025 – Sep 2025
Contributor | Go, CEL, Kubernetes CRDs, DaemonSets, AlertManager *Remote · Raleigh, USA*

- Stabilized and productionized **DaemonSet deployment mode** for the **PrometheusAgent** custom resource, enabling per-node scrape topology required by high-cardinality multi-tenant observability setups.
- Authored robust **CEL validation rules** on the PrometheusAgent CRD with runtime fallbacks and exhaustive e2e coverage:
  - CEL validations for invalid `replicas` / `storage` specs (#7588) and invalid `shards` / `PVCRetentionClaim` policy specs (#7595).
  - CEL prohibitions for `ScrapeConfigSelector` (#7729) and `probeSelector` (#7752) under DaemonSet mode, plus remaining validation closure (#7881).
- Expanded the **AlertManager** stack by implementing a **RocketChat receiver** in the `AlertManagerConfig` CRD (#7328), unlocking native RocketChat alerting for teams running chat-based incident response.
- Upstream hygiene: refactored `OVHCloudSDConfig` (#7238) and introduced a **GitHub Actions linter** workflow (#7123) to guard action-file quality across the repo.

Hooman Digital Apr 2025 – Sep 2025
DevOps Intern | Docker, Go, Terraform, vLLM, Ollama, MLOps *Remote*

- Authored a production-grade **Terraform provider for Nosana** in **Go**, automating GPU-container deployment on decentralized GPU infrastructure, published to the Terraform Registry under the `HoomanDigital/nosana` namespace.
- Optimized **Dockerized environments** for **GPU-accelerated inference workloads** (**vLLM**, **Ollama**) with careful resource-constraint tuning, reducing cold-start times and stabilizing throughput under concurrent model loads.

WeCofy Dec 2024 – Apr 2025
Full-Stack Intern | Next.js, Node.js, Express, MongoDB *Remote*

- Enhanced **Juristo**, an AI-powered legal platform, with full-stack feature development improving document workflow scalability and accessibility across client tiers.
- Built a **developer API service** with subscription tiers, dynamic **rate-limiting**, and integrated **ZeptoMail** transactional email and **Firebase Cloud Messaging** for push notifications.

Open Source & Community

CNCF Kyverno: *Namespaced Policy Variants* | PRs

- Shipped a complete policy family (`NamespacedValidatingPolicy`, `NamespacedImageValidatingPolicy`, `NamespacedMutatingPolicy`, `NamespacedGeneratingPolicy`, `NamespaceDeletingPolicy`) alongside a shared compiler interface, admission webhook wiring, and CI-wired Chainsaw tests.

Prometheus Operator: *DaemonSet Mode Stabilization* | PRs

- Drove CEL-based CRD validation and runtime fallbacks for PrometheusAgent DaemonSet deployments, end-to-end tests across shards/replicas/storage/volume paths, and AlertManagerConfig RocketChat integration.

Terraform Provider: Nosana (Hooman Digital) | registry.terraform.io

- Authored a Go-based Terraform provider for programmatic GPU-container deployment on the Nosana decentralized compute network, published on the Terraform Registry.

Achievements & Speaking

Accepted Speaker, KubeCon + CloudNativeCon India 2026: "Why Your Cluster-Wide Policies Are a Risk (And What to Do About It)", a talk on tenant-scoped admission control informed by the Kyverno namespaced-policy work shipped during LFX mentorship.

Winner, Smart India Hackathon 2025: placed **1st out of 820,000 participants** in India's largest government-sponsored hackathon, across problem statements released by ministries and partner organizations.

Google Summer of Code 2025 Contributor: selected under **Prometheus Operator** (CNCF) to stabilize PrometheusAgent DaemonSet mode and extend AlertManager receivers.

LFX Mentee 2025: selected for the CNCF Kyverno mentorship track focused on namespaced CEL-based policy variants.

Skills

Languages: Go, Java, TypeScript, Python, Bash, Lua, SQL
Infrastructure as Code: Terraform, Terragrunt, Ansible, Helm, Kustomize
Orchestration & Platform: Kubernetes (EKS), Docker, ArgoCD, KEDA, Kyverno, Atlantis
Observability: Prometheus, VictoriaMetrics, Grafana, Loki, Alloy, Beyla (eBPF), Vector, Quickwit, Datadog, YACE
Data & Messaging: Kafka (MSK), PostgreSQL (Aurora), DynamoDB, Redis, RudderStack
Cloud: AWS (EKS, ECR, RDS, MSK, DynamoDB, Secrets Manager, S3, IAM, KMS, Pod Identity), Hetzner Cloud
Edge & Security: Kong Gateway (Lua plugins, JWT, rate limiting), Traefik, Let's Encrypt, External Secrets, KMS envelope encryption
Backend Frameworks: Node.js, Express, Next.js, Gin
